Hiring Team
Arcadia

Dear Arcadia Hiring Team,

I am applying for the Lead Analytics Engineer - Data Modeling & Quality role because it closely matches the work I have built my healthcare data career around: turning complex clinical and claims sources into trusted models, tracing quality issues to their root layer, and creating systematic controls that prevent those issues from recurring.

Most recently, at HHAeXchange I engineered Snowflake and dbt models spanning 55 tables across two organizations and two source-system configurations, reducing onboarding time by 67%. I also created or materially redesigned 30 automated SQL/dbt tests and macros covering nulls, duplicates, referential integrity, lifecycle logic, business rules, and source-to-target reconciliation. The work required both technical depth and careful communication: I translated ambiguous findings into mappings, acceptance criteria, onboarding standards, and 12 investigation runbooks that could be used consistently by delivery teams.

Arcadia's combination of analytics engineering and data-quality ownership is particularly compelling to me. At Adonis, I standardized payer and revenue-cycle data across 54 models, implemented 117+ audit applications, and traced duplicate-key failures to undocumented source versioning before correcting the model grain. At Arkos Health, I built an AWS lakehouse environment using Athena, Redshift, Glue, dbt, and PySpark across approximately 200 scheduled assets and 200 dbt models, then added monitoring, alert classification, and incident runbooks. Earlier at IBM, I architected Spark and Hadoop pipelines for more than 100 billion clinical records and led validation across approximately 100 client integrations and 70+ EHR sources.

That experience would let me contribute quickly to Arcadia's ingest-through-silver modeling, connector promotion reviews, claims and clinical validation rules, and cross-functional root-cause triage. I would bring advanced SQL, hands-on dbt development, Spark-based healthcare data experience, and a practical quality mindset grounded in clear grains, observable controls, reproducible investigations, and client-ready findings. I am also comfortable using AI tools to accelerate analysis, verification, documentation, and operational workflows while preserving human review and data-governance standards.

Arcadia's mission to help providers and payers improve care while lowering cost resonates with the focus of my work over the past decade. I would welcome the opportunity to discuss how my experience building reliable healthcare datasets and scalable validation practices can support Arcadia's platform and customers.

Sincerely,

Ben Bubnick
